The hospital system is automated, but the benefit is only for some. In such a situation, we have figured out that there should be something for the patients. Some simple features for checking appointments, asking for appointments, prescriptions, and test reports can reduce the hassle by up to 70-80% because those are the sectors where we face a lot of trouble and can find a way out. So this will allow us something we have been waiting for so long. The world is moving to the internet, so this is the right time to think about this. We have checked some hospital management systems on the internet and some local programs the hospital staff uses near us. They are also very well designed and have rich features, but they are more geared toward the patient searching for doctors than connecting the patient to the doctor. If we compare the benefits and the satisfaction from every point of view, then we cannot conclude things beneficial for all. A system needs to provide help for every user group so it can be perfect. We have come a long way in maximizing benefits for all. Still, there can be many things, but at this point, this is the most we can expect. Two portals will be available on our website, Sheba. The first Portal is for the Admin, and the second is for the patients Portal. Patients must first check in to the Patient Portal to utilize this app. After that, a patient can view a list of doctors by selecting three options: fees, designation, or specialty. After researching, they can schedule a consultation with the doctor and choose which one they want to confirm. After logging in, patients can view their medical history and payment history. They have three options for paying the bill: cash, bkash, and a Visa card. Additionally, after an admin log in, the Admin can find all appointment history and decide whether to accept or reject a scheduled appointment. If the patient is their past patient, they can also view their prior medical history using this website. The Admin can also add a doctor and the doctor's information to the admin portal. If necessary, the Admin can also delete a doctor's input. The administrator can also change a doctor's data if it's essential.
